

TEMEDA MAINTENANCE MODULE

Providing complete life-of-asset maintenance planning, tracking and costing for your entire fleet

With Temeda it is simple to create maintenance plans using manufacturer recommended maintenance schedules or your own custom plans. As the time comes for equipment to be serviced, Temeda provides alerts so that you can be proactive and schedule maintenance.

As service is performed, your mechanic can input the work performed on our mobile friendly app. When you input the hourly rate, record hours worked and add parts consumed during maintenance, Temeda reports the total cost of work performed.

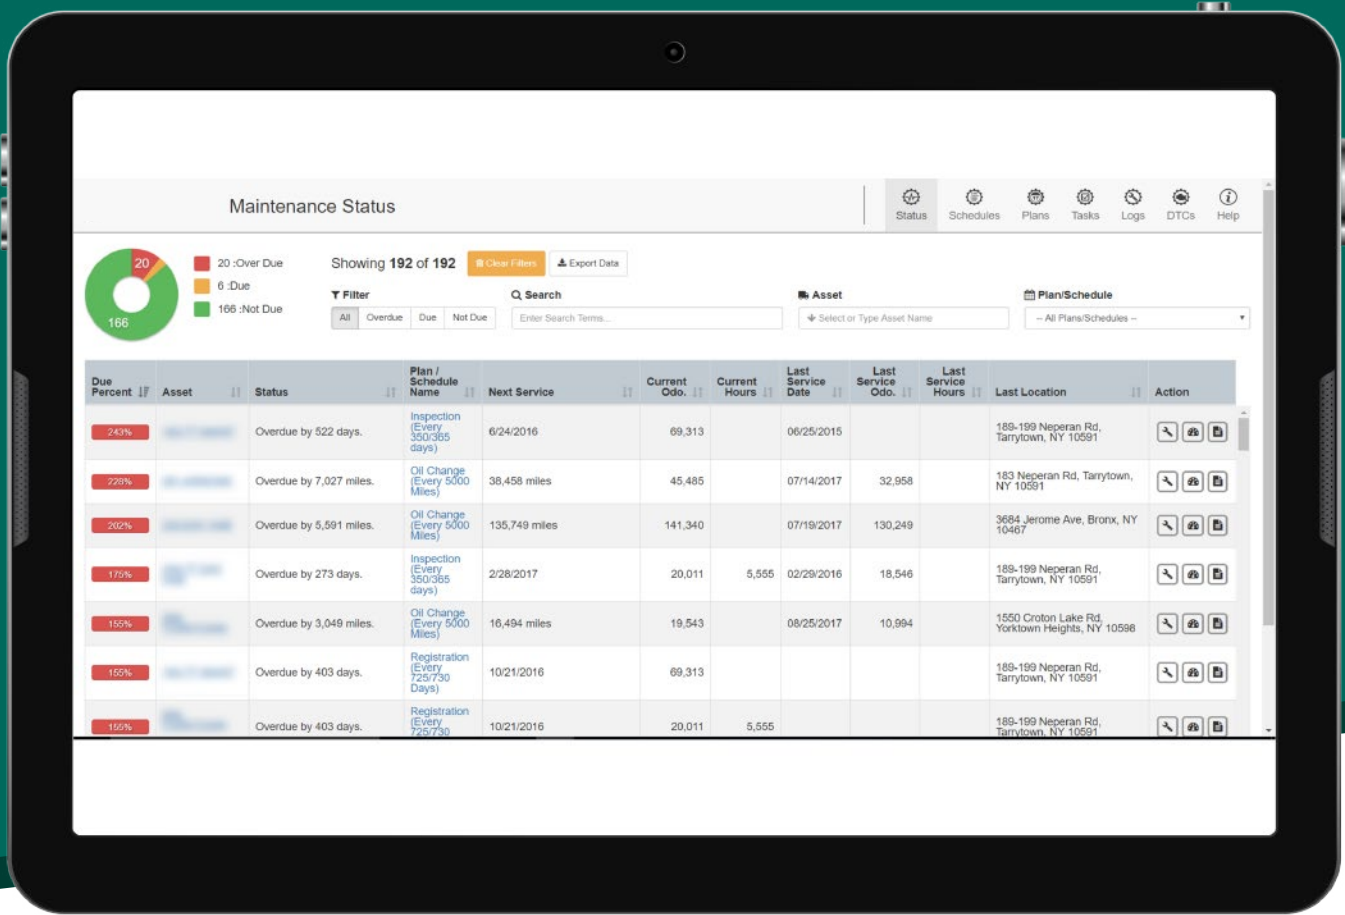

As you continue to perform maintenance over time, both scheduled and unscheduled, Temeda compiles the historical record of work and cost of maintenance. In the event of an asset sale, maintenance records are easily and quickly exportable to be used as 'proof of maintenance performed'. These records can help to gain maximum revenue and contribute to a quick sales process.

Temeda Maintenance Module

- Simple, flexible maintenance log creation
 - > Designed 'for mechanics' maintenance logging
 - > Mobile friendly
- Easy to add/remove assets from maintenance plans
- Supports both scheduled & unscheduled maintenance
- All asset types
- Real-time maintenance alerting
- Real-time maintenance reporting
- Status & status notification
- Quick / responsive application
- Mobile friendly

Complete Maintenance Record History

- Total cost of maintenance
- Generate higher resale price

Create Maintenance Schedules, Tasks

Temeda supports the development of equipment specific maintenance schedules for multiple service intervals. You can create a maintenance plan consisting of the specific tasks required at 200 hours, a different schedule of tasks for 500 hours, 1000 hours and so on. The Maintenance Module will then keep track of asset run time and notify you at the time of the next scheduled maintenance while identifying the specific tasks to be performed.

Alerts

No matter where your assets are located- on the job site, in the yard, or in the garage - you will always know when service needs to be performed. As a machine is approaching scheduled maintenance, the system provides alerts telling you what assets have maintenance due and where those assets are located. You can then schedule service to minimize disruptions and maximize equipment utilization.

Track Cost

The Maintenance Module was designed to make it simple for service technicians to check-off service tasks as they are performed. Service Technicians record work performed, parts used and hours spent at the appropriate hourly rate to calculate the actual total cost of maintenance performed. Maintenance records work performed, parts used and hours spent at the appropriate hourly rate to calculate the actual total cost of maintenance performed.

Unscheduled Maintenance

Accidents happen and even the best maintained machines break down from time to time. The Maintenance Module supports the ability to add unscheduled maintenance and repair work into the service history of an asset.

Warranty Recovery

With accurate usage and maintenance records, you'll make better use of your warranty entitlements.
